                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs and be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                             Peptide #6052 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

Sequences ABP31028-ABP35561 represent 4534 movel human proteins
designated ORF (open reading frame) 1-4534, and sequences ABN75054-
ABN79587 represent CDNAs encoding them. The invention also encompasses
CC Polypeptides at least 80% identical to the ORFN-CRR4534 (collectively
referred to as ORFN proteins, polymucleotides at least 85% identical to
the OREX nucleic acid sequences, vectors and hort cells comprising ORFN
CC the OREX proteins, methods of detecting ORFX polymucleotides and
polypeptides, methods of screening for modulators of ORFX expression or
activity, and methods of screening individuals for a predisposition to an
ORFX-associated disorder. The ORFX proteins of the impention have a wide
CC ARFX-associated disorder. The ORFX proteins of the impention have a wide
CC ARFX-associated disorder. The ORFX proteins of the impention have a wide
CC ARFX-associated disorder. The ORFY proteins of the impention have a wide
CC ARFX-associated disorder. The ORFX proteins of the impention activity,
CC C ARFX-associated disorders in antihitament or an antihitament of activity, thrombolytic activity,
CC C C bodily characteristics, fertility and behaviour. ORFX proteins
CC cardiovascular diseases, immune system disorders caused by viral, bacterial,
CC chemotropics and infectious associated by viral, bacterial,
CC cardiovascular diseases, immune system disorders caused by viral, bacterial,
CC fungal and other pathogens. Or tissue growth and regeneration,
CC fungal and other pathogens. Or tissue growth and regeneration,
CC fungal and other pathogens. Or tissue growth and redeared as a
CC source of primers and probes, in the detection and or or or cranacripes, in the identification and detection an

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements / fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipidemenia, hyperlipidemenia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia;
hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analysing gene expression in human adult liver -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      82.6%; Score 38; DB 22; Length 85; 87.5%; Pred.                                                                                                                                                                                                                                                              The present sequence is from an antithrombin III (ATIII) variant, Bb.D derived from human ATIII N135A CDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restences; thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and restences in percutaneous transluminal coronary angioplasty, and coagulation abnormalities in cancer or surgical patients.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is from an antithrombin III (ATIII) variant, Bb.B derived from human ATII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IGG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIS can be used to treat thrombin activationrelated pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restences thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and restencis in percutaneous transluminal coronary anglophasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        coronary angioplasty, ia/reperfusion injury, and

"Transcriptional regulation of the cell cycle-dependent thymidylate synthase gene of Sacchlation of the cell cycle-dependent thymidylate synthase gene of Sacchlation of the cell cycle-dependent thymidylate synthase gene of Sacchlation of the cell cycle-dependent thymidylate synthase gene of Sacchlation of the cell cycle-dependent thymidylate synthasis.
-!- CATALYTIC ACTIVITY: 5,10-methylenetetrahydrofolate + dUMP = dihydrofolate + dTMP.
-!- PATHWAY: Depoxyribonucleotide biosynthesis.
-!- SUBUNIT: Homodimer.
-!- SIMILARITY: BELONGS TO THE THYMIDYLATE SYNTHASE FAMILY.

EMBO J. 19:1366-1377(2000)

-!- FUNCTION: REQUIRED BOTH FOR THE LOCALIZATION OF MATERNAL

-- PUNCTION: REQUIRED BOTH FOR THE LOCALIZATION OF MATERNAL

-- PUNCTION: REQUIRED BOTH FOR THE LOCALIZATION OF MATERNAL

DETERMINANTS TO THE POSTERIOR FOLE OF THE DROSOFHILA EGG AND

FOR BITCOID RNA TO LOCALIZE CORRECTLY TO THE ANTERIOR POLE.

OSKAR PROTEIN IS REQUIRED TO KEEP OSKAR RNA AND STAUFEN PROTEIN AT

THE POSTERIOR POLE.

-- TISSUE SPECIFICITY: FOLAK GRANULES AT THE BOSTERIOR POLE.

OCCYTE, AND BY THE TIME THE EGG IS LAID, AT THE ANTERIOR POLE.

-- DOMAIN: CONTAINS A PROLINE-RICH DOMAIN. THE INSERTION OF THIS

DOMAIN IN THE DRBM 2 DOMAIN IS REQUIRED FOR STAU-OSKAR MRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A. The invention relates to 1 of 232 isolated or recombinant polymucleotides encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polymucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits except carpession or altered expression of one or more genes exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polymucleotides, a computer readable medium having stored sequence information, and identifying a nominial manual plant captured from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 46 fully defined sequences given in the specification. The isolated or recombinant polymucleotide is used for producing a plant having a

The present invention relates to recombinant polynucleotides useful for modifying the phenotype of a plant such as the plant's flowering time or flowering period leading to commercially superior crops and plants. Sequences of the invention are useful for modifying the duration of the phase in which floral meristems are initiated, the duration of time for which floral organs persist prior to their abscission or the number of flowers generated on a plant. They can also be used in the recombinant production of proteins, as regulators of plant gene expression, as substrates for mutation or PCR reactions, as diagnostic probes for the presence of complementary or partially complementary nucleic acids or presence of complementary or partially complementary nucleic acids or presence of complements or partially complementary nucleic acids or for identifying exogenous or endogenous modulators of the transcription factors. The present sequence is Arabidopsis thaliana G2010 protein. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                               ..
0
modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense nucleic acid, inserting the polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased the production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 proteins which are A. thaliana transcription factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phenotype, flowering, floral meristem; plant gene expression regulator; transcription factor modulator; G2010 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated or recombinant polynucleotide, useful for modifying the phenotype of a plant, such as the plant's flowering time or flowering period leading to commercially superior crops and plants

```
The present sequence is from an antithrombin III (ATIII) variant, Bb.A derived from human ATIII.N135A cDNA insert of the pabluebac baculovirus expression construct and comprises residues 385-393. The variant has expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be supersed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-respiratory distress syndrome, restencels, trauma, acute respiratory distress syndrome, restencels, thrombosis, thrombosis, and stroke It can also be used to reduce the risk of recoclusion and estences in percutaneous transluminal coronary angloplasty, and coagulation abnormalities in cancer or surgical patients.
 Human, antithrombin III; ATIII variant Bb.D; elastase-resistant; 1gG activated neutrophil resistant; anti-thrombin activity; heparin; anti-fancor Xa activity, blood clotting disorder; sepsis; trauma; stroke; thrombin activation-related pathological symptom; restenosis; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion.

 The present sequence is from an antithrombin III (ATIII) variant, Bb.B derived from human ATII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforum with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and stroke in percutaneous transluminal coronary angioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
 New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -

 The present sequence is from an antithrombin III (ATIII) variant, Bb derived from human ATIII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 185-393. The variant has expression construct and comprises residues 185-393. The variant has improved resistance to elastase and IgG-activated neutrophils while expressed as glycoforms with enhanced heparin affinity which target the copies as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsit, trauma, acute and attological symptoms due to sepsit, thromboshis, thromboshism and stroke It can also be used to reduce the risk of reocclusion and restenois in percutaneous transluminal coronary angioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.

 AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX31990) of Chlamydia pneumoniae. C. pneumoniae acuses respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyrgitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35679) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleorides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

recombinant raccoonpox virus containing foreign DNA inserted into a non-essential region within the HindIII U genomic region, useful as vaccine against pathogens in mammalian and avian species New

Disclosure, Page 151-152; 164pp; English.

The present sequence is that of a protein encoded by an open reading frame (ORF) in genomic DNA (see AAZSB057) of portine resproductive respiratory syndrome (RRRS) virus Eichelberger strain. The invention provides recombinant raccompox virus (RPV) contabining foreign DNA inserted into a non-sesential region within its genomic DNA. In a particular embodiment, the foreign DNA may be that of PRRS ORF2, ORF3, ORF5, ORF6 or ORF7. Homology vectors of the invention have a marker gene and a PRRS ORF flanked by RPV foreign DNA. The vectors are constructed for the purpose of inserting foreign DNA into RPV. The recombinant RPVs are used in vaccines to foreign DNA into RPV. T protect against disease.

```
hardyfor to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities canclude: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antidathetic; antidabetic; antidathetic; antidabetic; antidathetic; antidabetic; antidabetic; antidathetic; antidabetic; antidathetic; antidabetic; antidatic; coagulant; nootropic; vasotropic; antiportiatic and antidapics; the nootropic; vasotropic; antiportides can be used for preventing. treating or ameliorating medical conditions and diagnosing pathological conditions. Polymuclectides, polypeptides, antibodica, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmne disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate and antagonists and antagonists may be also be used in drug screens. Claim 20; SEQ ID No 59350; 103pp; English.
The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences colypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences consider an encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. athma), cardiovascular disorders (e.g. athmacory disorders (e.g. thaemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polymolectides of the invention can also be used in game therapy.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous
 Claim 11; SEQ ID No 1727; 1180pp; English.
```

```
The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating insorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in captor sorders or other trails to assess biodiversity responsible for genetic disorders or other trails to assess biodiversity and canno acid sequences of the inventor.

Complete amino acid sequence of the inventor.

Conduct man acid sequence of the inventor.

Conduct man acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the inventor.

Bock SC,

```
Human, antithrombin III; ATIII variant SEA; elastase-resistant; IgG activated neutrophil resistant; anti-thrombin activity; heparin; anti-factor Xa activity, blood clotting disorder; sepsis; trauma; stroke; thrombin activation-related pathological symptom; restenosis; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion.
 The present sequence is from an antithrombin III (ATIII) variant, 13.B derived from human ATII. N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be sypressed as glycoforus with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and stroke in percutaneous transluminal coronary angioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
 'note= "ATIII.N135A Val at 389 is substituted by Glu"
 /note= "ATIII.N135A Ile at 390 is substituted by Ala"
 New modified human antithrombin III compounds, used for treating e.g.
 sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism or stroke -
 Human antithrombin III variant 5EA (residues 385-393).

Ruben SM,

```
The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and entibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
 proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any involving abnormal angiogenesis, neurodegeneration and/or infectious diseases.
 New protein from Neisseria gonorrheae, useful for the manufacture medicament for treating or preventing N. gonorrheae infection
 invention relates to 26 secreted human proteins. The

The present sequence is from an antithrombin III (ATIII) variant, Bb.A derived from human ATIII M135A cDNA insert of the pBlueBac baculovins expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be carporessed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIS with normal heparin affinity. The modified ATIIS can be used to treat thrombin activational symptoms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thrombosis, and stroke. It can also be used to reduce the risk of reoclusion and stroke. It can also be used to reduce the risk of reoclusion thrombosis associated with surgery, ischnemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.

```
The present sequence is from an antithrombin III (ATIII) variant, 13.A derived from human ATIII. Nu15A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be sexplassed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restences, thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and stroke. It can also be used to reduce the risk of reocclusion thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
 IgG activated neutrophi resistant; anti-thrombin activity; heparin; atti-factor Xa activity; blood clotting disorder; sepsis; trauma; stroke; thrombin activation-related pathological symptom; restenosis; thrombosis; acute respiratory distress syndrome; thromboembolism; recoclusion.
 New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -
 'note= "ATIII.N135A Val at 389 is substituted by Glu"
 /note= "ATIII.N135A Ile at 390 is substituted by Gly"

 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences.

DEWTIFICATION, FUNCTION, AND INDUCTION.
MEDLINE-21569225; PubMed=11096119;
Welsman R., Choder M.;
"The fission yeast TOR homolog, torl+, is required for the response to starvation and other stresses via a conserved serine.";
J. Biol. Chem. 276:7027-7032(2001).
-I- FUNCTION: Phosphatidylinositol 3-kinase homolog required for GI progression and entry into stationary phase. Also required for the onset of meiosis and sporulation under nitrogen and carbon starvation conditions.
 -!- CATALYTIC ACTIVITY: ATP + 1-phosphatidy1-1D-myo-inositol = ADP +
1-phosphatidy1-1D-myo-inositol 3-phosphate.
-!- INDUCTION: By nitrogen and/or carbon starvation, cold, osmotic and
oxidative stress.
-!- SIMILARITY: BELONGS TO THE P13/P14-KINASES FAMILY.
-!- SIMILARITY: Contains 16 HEAT repeats.
